

ABSTRACT

Methods for peer to peer sharing of voice enabled document templates. One or more users are identified and a connection is established between the users. Users are assisted in identifying one or more voice enabled document templates and in displaying one or more of the templates between each other. Further, templates are identified on one or more computing devices and references to the templates recorded, with a listing of the references communicated to each of the computing devices. Moreover, a template associated with a first device is identified and displayed to a second device, where the template is used to interface with an audio device to generate a document.
